

QuickmatFIT

anatomically enhanced
sectional matrices

new!

accurate
natural
contour

Advantages

Enhanced natural curvature:
3D contoured matrix ensures
anatomically accurate
restorations

Three anatomical shapes
to cover all type of Class II
posterior restoration

Especially indicated in case
of wide interproximal spaces
and large cavities

Easy to handle.
The placement tabs afford
easier and faster matrix
insertion and removal

Time-saving solution.
Restored anatomy requires
fewer finishing steps

Thin, rigid but burnishable

sectional
matrices

QuickmatFIT

anatomically enhanced sectional matrices

accurate natural contour

Testimonial

"When it comes to matrices, we are faced with two imperatives that are difficult to reconcile: accessing and crimping deep margins while creating an anatomical emergence profile and proximal surface. In this respect, the QuickmatFIT sectional matrices from Polydentia combine a high-rigidity alloy with a unique three-dimensional profile, providing an easy solution to a number of difficult clinical situations."

for more information

Choosing a matrix able to mimic or reproduce the original morphology of the tooth and its curvatures is the first step towards a successful aesthetic and functional restoration.

Side view of the restoration before finishing and polishing showing the accurate morphological reconstruction afforded by QuickmatFIT matrices

Comparison - Matrix adaptation on teeth model

LumiContrast - sectional matrix indicated in case of standard interproximal spaces and cavities

QuickmatFIT - anatomical sectional matrix indicated in case of wide interproximal spaces and large cavities

QuickmatFIT are anatomically enhanced stainless steel sectional matrices with 0.04 mm thickness available in three anatomical shapes to cover all types of Class II posterior restorations. QuickmatFIT matrices are especially indicated for wide interproximal spaces and large cavities. Easy to handle thanks to their placement tabs, QuickmatFIT matrices feature a rolled occlusal edge for easy marginal ridge restoration.

The accentuated curvature of QuickmatFIT fits snugly around the tooth for improved fit and stability (compared to other Polydentia matrices), thus facilitating the attainment of proper restoration anatomy.
